My name is Ahmed Tajbiul Rawol. I am a Software developer at the software development division of American International University Bangladesh and also an Instructor at Edbase where I taught students how to code for robotics and motor dynamics.

I was always fascinated by programming as it seemed like a special ability to create new things with just your mind and a computer. After writing my first program, I was hooked! There was no going back. I was one of the first to be called to teach the students at Edbase to expose the upcoming generation of what programming is and how it will impact and change the future.

I was one of the first recruits among hundred others to be recruited as a student assistant. I am able to learn any technology stack quickly and efficiently and am very passionate about technology- not a specific language or framework. In this line of work, it's all about adaptation and what works best for the project. I am always open to learning any stack if it works and will only bolster my knowledge in problem solving.

My motto as a developer is if I am the smartest person in the room, I am in the wrong room. I love learning and aspire to be the best developer I can be. I am a maker. I enjoy creating in my career and after hours. I believe in shipping quality code and working in flow.

I have experience in peer code reviews, mentoring and pair coding sessions. I also have experience with tedious refactoring and re writing the code base both large and small. I have a history of working with small development teams and remote environments.

I deeply care about the code I write and the effect my work has on the product. I find satisfaction by thinking that my work is bringing joy to the clients when they use the application they want.

That being said - I think I align with what you are doing and believe I would be a great fit in the technology and culture wise.

Looking forward to hearing you back

Kind Regards.

Ahmed Tajbiul Rawol
